We performed mutational analysis of the smoothelin gene in patients with Marfan syndrome. We sequenced the DNA of this gene in 22 patients with Marfan syndrome. Overall, we identified nine missense mutations, four deletions, and two patients were homozygous for a splice-site mutation and one patient was homozygous for a deletion. No novel mutations or polymorphisms were identified. This is the first report of a causative mutation in Marfan syndrome. Analysis of the impact of the treatment of insulin resistance on the cardiovascular risk. Cardiovascular events have been consistently shown to be more frequent in patients with Type 2 diabetes mellitus than in the general population. Insulin resistance is one of the major determinants of cardiovascular risk. Long-term glycemic control can reduce the risk of cardiovascular disease by its beneficial effect on insulin resistance.

Hyperinsulinemia, however, and the consequent increase of the cardiovascular risk have been demonstrated in patients with Type 2 diabetes after monotherapy with sulphonylurea. In normoglycemia, glucose fluxes can be increased by the treatment of insulin resistance. This observation suggests that on cardiovascular risk in patients with Type 2 diabetes, the treatment of insulin resistance may have an additional beneficial effect. The metabolic background of such beneficial effect, however, remains still to be defined. Popular November 25, 2008 Innovative Battery Manufacturer Introduces Cheaper But More Efficient Chemistry by Sam Savage Sometimes, research and development starts in unexpected places. American Siemens Energy is now working with Kansai Electric Power and other energy suppliers to create a more energy efficient lithium-ion battery chemistry. Because it requires a lower amount of energy to manufacture, it costs less to install and can
